

Weekly Blog Article List

Prepared for review | kanhustlefitness.com/blog

The first six articles below are already drafted and ready to publish (research-backed, with sources cited in each). The remaining four are proposed topics for upcoming weeks, pending a decision on which to run next.

#	Article Title	Status	Brief Description
1	Why So Many Young Fast Bowlers Get Injured — And What New Research Says Actually Prevents It	Published Sep 14	Links sudden bowling-workload spikes to a 2.45x injury risk 3–4 weeks later, and shows how targeted strength training cuts that risk.
2	How Much Exercise Actually Protects Your Heart?	Published Sep 19	A UK Biobank study of 17,088 adults shows the standard 150 min/week guideline buys only 8–9% lower heart-disease risk — real protection starts near 560–610 min/week.
3	Bronco Test vs. Yo-Yo Test: How to Train for BCCI's Tougher Fitness Standard	Published Sep 20	Explains BCCI's newer, harder fitness benchmark and gives a practical training plan for players preparing for HCA trials.
4	Cricket Fielding Fitness: The Most Overlooked Skill in Age-Group Cricket	Published Sep 20	Breaks down position-specific fielding demands and injury patterns, with a training approach most age-group programs skip entirely.
5	3 Minutes of Sprinting vs. 90 Minutes of Cardio	Published Sep 21	New research shows a 3-minute all-out sprint protocol triggers far more beneficial molecular changes than 90 minutes of moderate cardio.
6	Want More Bat Speed? Here's What the Research Says Actually Builds It	Published Sep 28	Identifies the specific strength qualities (pulling strength, rotational power) that predict bat speed, timed to the new domestic season opener.
7	Wicket-Keeping Fitness — The Toughest Job on the Field Nobody Trains For	Proposed —	Keepers squat 200–400 times and cover 2–4km per match day — covers the dedicated conditioning approach this role actually needs.
8	Sleep as a Performance Tool, Not a Luxury	Proposed —	Summarizes current research on how sleep duration and quality drive strength, recovery, and injury risk — relevant to every client, not just cricketers.

#	Article Title	Status	Brief Description
9	Protein Timing, Revisited: Why <i>When</i> You Eat It May Matter More Than You Think	Proposed —	A 2026 study found spacing protein into distinct doses every 3–4 hours boosted muscle protein synthesis 31% over continuous "grazing."
10	Japanese Walking: The Science Behind 2026's Fastest-Growing Fitness Trend	Proposed —	Explains the research behind interval walking training — a low-barrier trend that saw a ~3,000% surge in search interest this year.
